Assignment 4: Final Project Proposal & Wireframing

For my final project, I would like to create a website of a collection of images that I've taken over the years. The site will be primarily a gallery site meant to feature the images, while giving a bit of information about each image. It would be nice if I can get the description to appear over the image as the user scrolls through the page. Since the photographs are pretty diverse, I would like to give the user the ability to filter through types of images. For example:

- ALL
- LANDSCAPE
- MOTION
- STILLLIVE
- EXPERIMENTS

Since some images belong to multiple categories, I need to figure out a way to have images be under various categories, as opposed to making multiple pages. A simple motion effect would be great when the user switches categories.

Other interactive features I would like to incorporate are – a small series of fixed icons that let you know how far down you are on the page, and another button that lets you switch between index view, and full spread per image view. There are couple of layouts that I have in mind, still thinking about which would be best. You can see the variations under the sketched wireframes.
